RESEARCH PORTFOLIO / STATISTICAL SURVEY ANALYSIS

Knowledge About Higher Studies Abroad Among Undergraduate Students

Awareness, motivation, preparation, barriers and post-study intentions

Cross-sectional survey	385 undergraduate respondents	Microsoft Excel · IBM SPSS

Prepared by

Mahmudul Hasan | Data Analytics Portfolio

Pabna University of Science & Technology (PUST) · Survey case study

An evidence-focused presentation of the findings reported in the supplied portfolio. Statistical results have not been independently recalculated from raw survey data.

01 | Executive summary

This cross-sectional field survey examines how undergraduate students understand and prepare for higher education abroad. The supplied study describes 385 respondents from five faculties, selected through proportional stratified sampling.

The central finding is an awareness-to-action gap: many students have heard of overseas education, yet far fewer report detailed knowledge or concrete preparation. Financial constraints, English-language skills and limited guidance appear as important barriers.

385	87.5%	16.1%
Survey respondents	Have heard about study abroad	Report detailed knowledge

Study at a glance

Population	Undergraduate students at PUST
Sample	385 respondents across five faculties
Sampling	Proportional stratified sampling
Methods	Descriptive statistics, cross-tabulation and chi-square tests
Topics	Awareness, motivation, preparation, barriers and post-study intentions

02 | Analytical methodology

The original portfolio describes a structured workflow, beginning with questionnaire design and ending with statistical interpretation and reporting. The stages below summarize that stated process.

01 · Questionnaire	Structured questions on awareness, motivations and barriers
02 · Sampling	Proportional representation across five faculties
03 · Data preparation	Survey response entry, organization and cleaning in Excel
04 · Descriptive analysis	Frequencies, percentages and distributions
05 · Association testing	Cross-tabulation and chi-square tests for categorical variables
06 · Communication	Visual summaries, interpretation and practical recommendations

Interpretation note

Reported percentages and p-values are reproduced from the supplied portfolio. The underlying dataset, test statistics, contingency tables and questionnaire were not provided with this PDF, so causal conclusions and independent statistical verification are not possible.

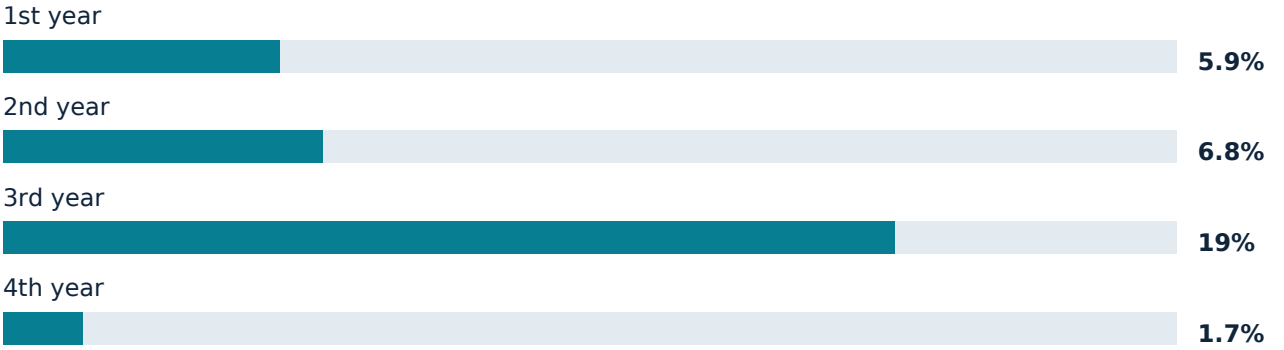

03 | Awareness, preparation and motivation

General awareness substantially exceeds detailed understanding of international study requirements.

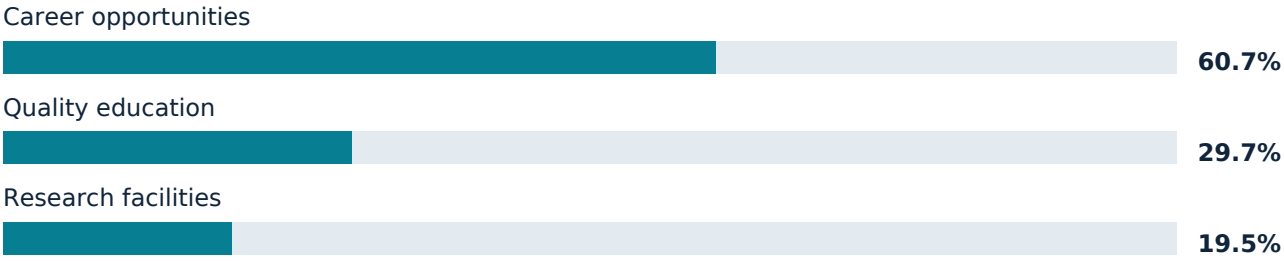

Awareness and knowledge

IELTS/GRE preparation by academic year

Top motivations

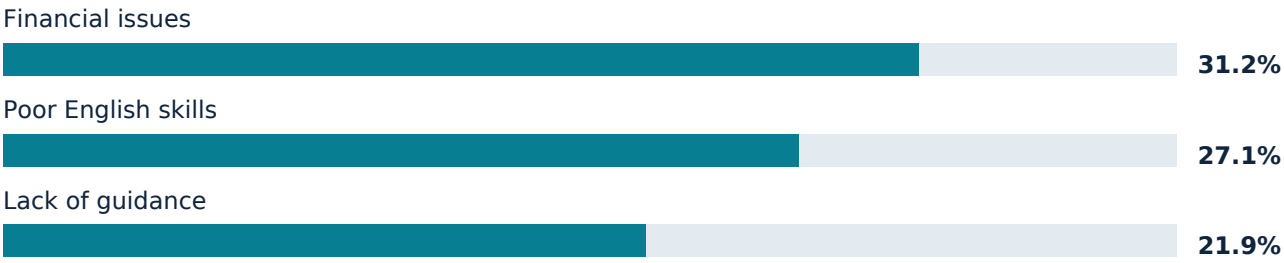

Percentages reflect the original portfolio; motivation categories may not be mutually exclusive.

04 | Barriers and statistical findings

The survey identifies financial concerns, English-language challenges and insufficient guidance as prominent obstacles to pursuing higher education abroad.

Most frequently reported barriers

Reported chi-square findings

Financial issues	0.0124	Statistically significant
Lack of guidance	0.0291	Statistically significant
Unclear admission process	0.0004	Statistically significant
Family restrictions	0.8521	Not statistically significant

These results indicate reported associations with application intent at the 5% significance threshold; they do not establish that the barriers cause changes in intent.

05 | Post-study intentions and implications

The original study reports a contrast between personal migration plans and perceptions of national benefit.

28.1%

Plan to settle abroad

79.7%

Support national development

Practical recommendations

Guidance	Establish a dedicated higher-study support cell
Funding information	Offer scholarship discovery and application workshops
Preparation	Provide IELTS/GRE resources and early-year advising
Peer support	Connect interested students with alumni mentors
Application clarity	Publish clear admissions timelines and checklists

Conclusion

The reported evidence suggests that aspiration is widespread, but access to actionable information and structured support is uneven. Earlier guidance, financial information and practical preparation support could help students make more informed choices.

06 | Research portfolio notes

This document presents the study as a professional data-analysis case study rather than a sales or service advertisement.

Capabilities demonstrated

Survey structure and stratified sampling	Executive summaries and visual storytelling
Excel-based data preparation	Clear presentation of descriptive results
SPSS-based statistical interpretation	Chi-square findings in accessible language
Cross-tabulation and comparison	Evidence-linked recommendations

Scope and limitations

The analysis is limited to findings presented in the supplied seven-page portfolio. No raw data, codebook, SPSS output files or original survey instrument were supplied for independent validation. Figures are reported as provided; any apparent differences in denominators or category definitions require checking against the original dataset.
